

PRODUCTGROUP TIMING CHAIN KITS PTA114-....

GENERAL NOTES ON INSTALLATION

1. When repairing the timing chain drive, all components of the supplied timing chain kit must be installed.
2. A change of the engine oil is absolutely necessary, before commissioning the new timing chain drive.
3. A check of the engine oil system (e.g. oil pump) and a subsequent measurement of the oil pressure are generally strongly recommended when working on the timing chain drive.
4. For timing chain drives with camshaft adjusters, a change of the existing camshaft adjusters is recommended or even mandatory. Please follow the instructions!
5. It must always be checked whether components (e.g. control valves for camshaft adjustment) have to be relearned to the engine control unit or the adaptation values have to be reseted after changing the timing drive components.
6. The availability of an update for the engine control unit must be checked before commissioning the new timing chain drive. Disregard can lead to the extension of the timing chain!
