

CamLock

Retaining Tool Set, camshaft sprocket

This tool set is used to lock cam gears, injection/HP pump gears and balancer shaft gears when replacing a timing belt and also prevents shafts from twisting inadvertently. The locking arms, which can be adjusted both horizontally and vertically, make the tool suitable for all

petrol and diesel engines with timing belts. This does away with the need for a variety of special tools specific to different manufacturers and models. Even hard-to-reach gears in tight spaces can be individually secured, safely and easily with the help of the single locks.

Material: GRP (Glass fibre Reinforced Plastic)
