To Fit:

MAN E-TGM, Lion's Explorer, TGL, TGM, TGS,
TGX

EN

Switch for steering column adjustment

Function

Located in the cab near the steering column, this switch is used by the driver to adjust the steering wheel to provide an ergonomic seating position and make getting in and out of the vehicle easier. In trucks and buses operation by means of compressed air is common, and accordingly, the connections at the rear of the switch are pneumatic. When the switch is actuated, the angle and height of the steering wheel can be adjusted.

Cause of failure

As with all pneumatic components, leaks can occur when the mechanics of the switch or the hose connections fail. This is especially common in vehicles used on construction sites and in distribution transport where the driver needs to regularly enter and exit the cab; the resulting frequent use of the switch leading to increased wear. If there is a significant loss of pressure or a defect in the mechanics inside the switch it will no longer function, and as such the steering wheel will remain locked in its current position. However, the function of the vehicle's steering is not impaired.
