LSP017 MODIFICATION TO REDUCE CARBON CONTAMINATION AND EXTEND LIFE

Why the Lucas Plug Looks Slightly Longer

The latest Lucas design was updated to fix an issue where the older version could carbon-foul more quickly in certain engines. To improve heat transfer and keep the plug cleaner for longer, the internal heat-dissipation structure was redesigned.

This improvement means the outer metal shell is very slightly longer than the OE plug, but it does not affect fitment or how the plug seats in the engine.

Since introducing the updated design, related issues have dropped significantly proving the Lucas design works better in real world use.
