

IMPORTANT PRODUCT INFORMATION

Pneumatic release systems must be calibrated with a suitable diagnostic unit after installation, regardless of the vehicle manufacturer.*

1. Coarse air filter 2. Fine air filter 3. Pneumatic release system

Failure to calibrate the system may cause the following errors:

- Grabbing clutch when setting off
- Poor vehicle movement when loaded
- Error message in display

If the product is not calibrating, it may be due to:

- Outdated vehicle software
- Insufficient compressed air supply within the vehicle
- Clogged air filters, causing low air pressure in the clutch release system

When connecting the airline adaptor to the back of the pneumatic unit, do not exceed 4Nm of force. Overtightening will snap the connection pins.

If the system is failing, follow these steps:

*Always follow the vehicle manufacturer's specifications.
